Instructions for determining the phase-equilibrium curve
 from the composition curve for two-component
 liquid mixtures. M. Balazs, J. Macosko, and W. R. Krigbaum,
 J. Polym. Sci., Part A: Polym. Chem., 11, 1001 (1973) (English summary). Two equations are
 given to solve an equation defined by the authors which
 permits calculation of the composition of the vapor phase in equilibrium
 with the liquid phase of a two-component real mix of liquids
 on the basis of the liquid-phase composition. To obtain the
 means of applying the method, an example of a real H₂O-
 C₂H₅OH (1-4) binary system at 760 mm. Hg was discussed.

Bukala M., Majewski J., Rodziński W. Nomographs for Determining the Curve of Phase Equilibrium Liquid-Vapour from the Curve of Composition of Two-Component Liquid Mixtures.

„Nomogramy do wyznaczania krzywej równowagi międzyfazowej ciecz-para z krzywej składu dwuskładnikowych mieszanin cieczy”. *Przemysł Chemiczny*, No. 4, 1955, pp. 189-190, 4 figs., 2 tabs.

Two nomographs are given for solution of the equation deduced by the authors. The equation makes it possible to calculate the composition of vapour phase in a state of equilibrium with liquid phase of a two-component real mixture of liquids on the basis of knowledge of liquid phase composition. By way of explaining the manner of applying the method described, an example of the mixture water-(2-methyl-3-butyl-2-ol) at 769.5 mm Hg is discussed.

 Zakrzewski, J. Apparatus for Determining Curves
 of Composition for Two-Component Mixtures. CH

Abstract do wyznaczenia krzywych składu ciekłych mieszanin.
 Przemysł Chemiczny, No. 5, 1960, pp. 94-97, 5 figs., 4 tabs.
 An apparatus for determining the curves of composition of two-
 component liquid mixtures is described. The essential of measure-
 ment is the determining by the static method of the total pressure of
 saturated vapours over liquid mixture. A single filling of the apparatus
 makes possible a series of measurements of vapour pressure at differ-
 ent temperatures. It is possible with the apparatus to determine in
 liquid phase isobars (x - p) and isotherms (x - p) which can be used to cal-
 culate the equilibrium curve (x - y). The optimum conditions of separa-
 tion of mixtures can be simulated by a relatively small number of
 measurements carried out in a short time. The total pressure of saturated
 vapours of multicomponent liquid mixtures can be determined equally
 well on this apparatus.

14-00000-1
 Calculation of the vaporization curve of a binary mixture
 vapor for real two-component mixtures from the curve of the
 liquid phase composition. M. Buzin, J. M. Givani, and W.
 Kozlinski. (Wroclaw Politechn., Poland). *Chem. Abstr.*
 10, 397-402 (1966) (English summary). — The course of the
 vapor phase is calculated from a 2-component curve of liquids
 calculated from the relation between the composition of the liquid
 and its composition under constant pressure. The method can be
 applied to azeotropic mixtures, for which the composition of azeotrope
 can be found under given pressure and temperature. If the
 mist does not give an azeotrope, the composition of vapor phase
 for one freely chosen curve of the mist is necessary. Exact-
 ness of the results obtained depends on exactly data, the
 pressure of each vapor of the pure components. The de-
 viations from the exact data for the system $\text{H}_2\text{O}-\text{EtOH}$
 did not exceed 0.1%.

J. Wozniak

Presence of saturated vapors of various hydrocarbons
 constant components of Polak's hydrocarbons from com-
 mon pine. M. Bukala, J. Malinowski, and W. Rostkowski.
Presence Chem. 10, 4-11 (1957) (English summary). The re-
 sults of the measurements of saturated vapor pressure of terpenes hydro-
 carbons, main components of saturated vapors of Polak's com-
 mon pine, made in a static method, in the temp. range 20-
 40°C, are given. The results are in good agreement. The calcu-
 lated values of saturated vapor pressure of these hydrocarbons

at higher temp. show a tendency to diverge for mono- and
 bicyclic terpenes, whereas the contrary is true for A-
 myrcene, which has a chain structure. The equation $\lg p =$
 $[-A/(C+D)] + B$ represents the relation between vapor
 pressure and temp.; the constants A, B, and C for the investi-
 gated terpenes are given. The maximum deviation is ± 0.3 mm.
 Hg in relation to the calcul. values. Gen. A. W. Wainy

Bukala M., Majewski J., Rodzinski W. Phase Equilibrium State of the Liquid-Vapor System for Real Two-Component Mixtures.

POL. 2

„Stan równowagi międzyfazowej układu ciecz-pary dla rzeczywistych mieszanin dwuskładnikowych”. Przemysł Chemiczny, No. 4, 1951, pp. 197-201, 5 figs., 8 tabs.

Two-body apparatus was used to determine curves of equilibrium and composition of further two-component mixtures of terpenes: α -pinene, Δ^4 -carene, 1-limonene, dipentene and terpinolene (under pressure of 20,35,50 mm Hg). The range of pressures investigated does not influence the shape of the curve. How to apply empirical Prahl's equation for designing the curve of equilibrium is shown. The equation is indicated for the terpene systems investigated and proves specially suitable for the system α -pinene-terpinolene, the relative volatility α of which varies within wide limits (ca 30%) over the whole range of concentrations.

Matkowski, S., Matkowski, J., Radziński, W. An Instrument for Determining
the Static Vapour Pressure of Saturated Vapour.

"Aparat do oznaczania predkosci par nasyconych metoda statyczna".
Przemysl Chemiczny, No. 11, 1963, pp. 594-595, 1 fig., 2 tabs.

A description of a new type of instrument for measuring the
pressure of saturated vapour by the static method within a pressure
range up to about 1200 mm. Hg. Approx. 5 cc of liquid is sufficient
for the measurements. A manometer with optional liquid is used but
is not an integral part of the instrument. The temperature of the system
is stabilized by a Hoppler thermostat. A single filling of the instru-
ment with the liquid investigated enables a series of measurements in
various temperatures to be carried out continuously by a very simple
technique. The compactness of the instrument renders it air-tight and
easy to transport.

547.598.5 : 541.123.2

Bukala M., Majewski J., Rodziński W. The State of Phase-Equilibrium of the Liquid-Vapour System for Real Two-Component Mixtures. Ter.
Dopas. I α -pinene - β -pinene.

"Stan równowagi międzylazowej układu ciecz-para dla rzeczywistych mieszanin dwuskładnikowych. Węglowodory terpenowe: I α -pinen - β -pinen". Przemysł Chemiczny, No. 10, 1959, pp.51 - 520, 5 figs., 3 tabs.

Determination, by using a two-tray instrument, of the curves of equilibrium and of composition, together with the coefficients of activity for α - and β -pinene mixtures, under pressures of 15, 30 and 85 mm Hg. The results of experiments were, by using the equations of van Laar, Margules and Redlich-Kister, compared with the thermodynamic relations. A method is described of defining the equilibrium curve for an imperfect mixture of a two-component liquid, taking advantage of data on the pressure of saturated vapours from pure components and of parameters (obtained on an experimental basis for one freely chosen composition of the mixture) determining the state of equilibrium.

Apparatus for the determination of vapor pressure by a static method. M. B. Dole, J. Malina, and J. S. Kanski (Warsaw, Poland), *Poland*, 1968, 170,000, 170,000 (1969) (English summary). The vapor pressure is measured with the aid of a liquid manometer filled with any suitable liquid. The manometer forms a sep. and is connected by a system of glass tubes and cocks with the evap. section of the app. Any no. of measurements can be made at various temps. without any filling of the manometer. The app. can be used for the detn. of vapor pressures up to 1200 mm. Hg. Vapor pressure curves are given for CHCl₃ and CCl₄, and the data obtained are compared with those given in *International Critical Tables*. At most temps. the agreement is within 2-3%.

Automatization of laboratory fractional distillation process.
 W. M. Bukala, J. Majewski, and A. Sienkiewicz. *Praktycz.
 Chem.* 3, 324-36 (1957) (summary). Collins and
 Lantz, *C. I.* 41, 630. An electronic device for automatic
 control of distn. speed in lab. columns has been designed.
 It is based on dielectric properties of distn. liquids. An
 elec. condenser placed in the distn. head has been applied as
 an indicator. The device is adapted to control the process
 of fractional distn. of dielectric liquids, especially terpenes.
 The operation of the device is independent of the speed of
 distn. and its exactness is approx. 5%. VI. M. Bukala,
 J. Majewski, and W. Rodzinski. *Ibid.* 32, 75. A distn.
 head for lab. fractional distn. with an indicator in the form
 of an elec. cylindric condenser regulating electronically the
 speed of distn. has been designed. The range of speed is
 60 to above 300 cc/hr.; however, its upper limit can be
 moved to above 2000 cc/hr. by interchanging suitable parts
 of the head. The head is provided with a solenoid piloted
 by an electronic regulator of cycles to regulate the condensa-
 tion. Gen. A. Werny.

1445. MAJEWSKI C. Zakł. Anat. Patol. A. M., Poznań. *Badania histochemiczne kwasów nukleinowych w wątrobie u zmarłych wśród objawów pooperacyjnego przełomu tarczycowego. Histochemical study of the nucleic acids of the liver cells in subjects deceased with symptoms of a postoperative thyroid crisis PATOL. POL. 1956, 7/3 (257-262) Tables 2

An increase of DNA in the nuclei of the parenchymal cells of the liver was observed in 11 cases where death had occurred as the consequence of a thyroid crisis after strumectomy for Graves-Basedow disease. This increase is supposed to represent a primary reaction of the liver cells to the toxic action of thyroxine.

 Matewski, Alexander. O wysokich stanach wody na zalowie Wislany. [On high water levels in the Vistula Bay.] *Prace Instytutu Meteorologicznego i Hydrologicznego*, Warszawa, 6(3/4): 35-52, 1953, pub. 1954. 5 figs., 10 refs. English summary p. 52. DWB—A survey of the dynamics and amplitudes of variations of the water levels in the Vistula Bay and an analysis of phenomena causing them are presented on the basis of water gage data for 1901-1952 (interrupted from 1941 to 1946 by the war). It shows the existence of 2 types of variation: 1) the more or less violent caused by winds blowing in the direction of the long axis of the bay —N and NE—in which only the waters of the bay are involved, and 2) the slower and quieter caused by W and SW winds in which sea waters rush through the Pilawska (canal) passage into the bay and raise the water level of the whole bay. Generally, both these types occur concurrently and the second type precedes the first. Inflowing rivers take only a small part in the rise of water levels. The amplitude of water level fluctuations in the eastern part of the bay varies between +160 cm (1949) and -189 cm (1881). Twenty-four-hour fluctuations amount to 1.5 m and the maximum rise of the water level in 1949 was 25 cm/hr. Graphs show heights of the maximum water levels in the bay during various periods of high water. Subject Headings: 1. Water level variations 2. Wind effects on water level 3. "Comparative Studies of Human Blood Proteins and Those of Experimental Animals"

Warsaw, Medycyna Doswiadczalna i Mikrobiologia, Vol 18, No 1, 1966; pp 83-88.

Abstract [English summary modified] : When studied by the same method, rabbits' serum proteins were more similar to human ones than those of rats or guinea pigs. Total proteins, erythrocyte sedimentation rates and haptoglobin levels were all lower in the animals than in man. Table, 2 electrophoregrams; 9 Polish and 1 Western reference.
